How Does the emteria Device Hub Work?

Emteria Device Hub is a powerful cloud platform for developers and product managers. Configure and build Android images that perfectly fit your requirements. Scale an image to thousands of devices with just a few clicks. By regularly integrating the latest security patches, IoT products are kept safe and secure.

Besides OS configuration and OTA updates, Device Hub enables remote management and monitoring for every single device. With Device Hub you can build future-proof solutions that integrate updates as part of the product.

Advantages of the emteria Device Hub

Automatic Android Builds

Configure and automatically build Android images including latest security patches, important fixes and new product features.

OTA Update Management

Rollout Android OS updates to a fleet of devices - automatically, phased or scheduled – fully remote. Shipped products will never be outdated anymore.

Mobile Device Management

Role-based management, monitoring and troubleshooting of Android devices from the Device Hub dashboard – no matter where you and your devices are.

App Management

Host and distribute custom and 3rd-party apps for your devices remotely with a private application repository and F-Droid.

Vulnerability Monitoring

Get warned about known CVEs, be informed about existing patches and prioritize your updates. Stay one step ahead of the attacker.

Data Governance

Your Android image is available only for your company. Ensure independence from Google and full sovereignty over your device and user data.

“ The wide range of developer options and easy configurability of emterias Android OS enabled us to significantly reduce time to market for our GSD 350. The cooperation with emteria also allows us to leverage cost advantages.

Prof. Dr. Lars Grossmann
Managing Director DREEBIT GmbH
